COMPARISON

AI Kids Lab vs WhiteHat Jr: what actually changes for your child

Both promise to get kids building with technology early. The honest difference is in the format, who's teaching, and what your child walks away with. Here's how the two compare, category by category.

WhiteHat Jr popularised the idea that young children could learn to code, and its live one-to-one online model made "my child is learning to code" a familiar sentence in a lot of Indian households. It's a reasonable starting point for a first exposure to logic and screens. AI Kids Lab exists for a different, more specific job: helping a 9 to 15 year old actually build a working AI project, in person, alongside other kids, with a mentor who has shipped real products.

Neither approach is "wrong" — they're built for different outcomes. Here's how they actually differ where it matters.

What matters	AI Kids Lab	WhiteHat Jr (typical model)
Format	**Fully offline, in-person cohort in Hyderabad**	Live online classes, one screen, one mentor
Group setting	**Small in-person cohort of 15 kids who build alongside each other**	Mostly 1:1 online sessions, limited peer interaction
What's taught	**Real AI tools — Teachable Machine, Scratch AI extensions, MIT App Inventor, ChatGPT & Claude, no-code builders, and Python basics for teens**	General coding fundamentals, games, and app-building blocks aimed at a broad age range
Mentors	**IIT, IIIT and BITS alumni and engineers who've built products at companies like Google, Amazon, and Microsoft**	A large network of instructors, varying in background and tenure
End output	**One real, working AI project the child can demo and explain**	Course-based progression with periodic mini projects
Admission	**By short discovery interview — we keep cohorts small on purpose**	Open enrolment, sales-led onboarding call
Contract style	**Single cohort commitment, no multi-year lock-in**	Often sold as multi-level, multi-year packages

The biggest practical difference is presence. An in-person room changes how a 9 to 15 year old engages with a mentor — they can point at the screen, ask a question mid-thought, and get unstuck in seconds instead of typing into a chat window. It also means your child is building next to other kids who are curious about the same things, which does more for motivation than any curriculum slide.

Where WhiteHat Jr’s model genuinely works

If you're outside Hyderabad, need flexible timing around school and other activities, or you're looking for a first, low-commitment exposure to coding logic for a younger child, a live online 1:1 format is a legitimate starting point. It removes the commute and lets you test the waters before committing to anything deeper.

Where AI Kids Lab is built for something different

We're not trying to be a broad, always-on coding curriculum for every age. We run one thing well: a focused, in-person cohort where a 9 to 15 year old spends real hours building an actual AI-powered project — a chatbot, an image classifier, a simple AI-powered game, or a recommendation tool — with a mentor who has done this kind of work professionally. Fifteen seats per cohort is a constraint we keep on purpose, not a waitlist tactic.

> **The question isn’t which platform has more lessons. It’s what your child can point to and say, ”I built this,” at the end.**

How to decide

- If your child is very new to screens and logic, and you want a flexible, low-stakes first step — an online model can be a fine on-ramp.
- If your child already has some exposure and you want them to walk away with a real, demonstrable AI project and hands-on mentorship — an in-person, project-based cohort is built for exactly that.
- If you're based in Hyderabad and can attend in person, that changes the calculation considerably in favour of a hands-on cohort.

The best way to know for sure is a short conversation. We keep our discovery interviews unhurried and specific to your child — not a sales script.

See if your child is a fit for the next cohort

15 seats, admission by interview. A 30-minute conversation tells us — and you — whether this is the right next step.
